5 steps

to help you modernise
B2B payments →

01

Understand what you have

Leverage AI for system and dependency mapping to understand workflows and business logic buried in your systems.

02

Design for real-time

Consider both the front end of payment processing and authorisation and all dependencies from liquidity to fraud.

03

Design for scale
your future platform will need to manage more payments, in more locations and for more customers.

04

Build for the cloud and understand the impact

Countries may have their own data localisation rules, meaning your system may need to run there to facilitate payments.

05

Data at the heart

You'll need the systems to capture and store more data to capitalise on AI and to enable the composable architectures you'll need for rapid feature deployment.
